

# Engineered Systems for 360-Degree Environmental Control

Automated, physics-based ultra-fine misting systems that treat air and surfaces with sub-10 micron, 360-degree coverage.

## Who We Are

Secure Logic™ is a micro-droplet misting technology company that invents automated systems to control and improve indoor environments. Our Genesis360™ Misting System Platform utilizes physics to achieve a sub-10 micron, ultra-fine droplet, precision nozzle engineering, and industrial-grade automation to deliver consistent coverage, while reducing labor costs and chemical waste. Our patented novel technology enhances all indoor spaces.

## Why Genesis360™

- 360-degree wrap-around coverage
- Fully automated, reducing labor costs
- Precision-engineered, ultra-efficient nozzle technology, smallest, most ultra-fine droplets in the world
- Dust suppression
- Zero humidity or temperature impact
- Consistent coverage, reducing human error and chemical waste

## Founders on a Mission

For more than 23 years, Marty Boquet (Co-Founder/CEO) led one of the Gulf Coast's largest restoration and indoor air quality firms and kept seeing the same failures: inconsistent labor, missed surfaces, wet sprays that damaged materials, chemical waste, and HVAC systems that quietly spread pathogens—even before COVID exposed how serious the problem was. A highly effective botanical disinfectant helps control pathogens in many environments, but as long as people were doing the spraying, results stayed unpredictable and costly.

Drawing on Marty's restoration and indoor air quality-control experience and Josh Morvant's 20+ years in construction and engineering, we set out after COVID to remove the human variable. Our goal was to build an automated, physics-driven system that converts liquid into a sub-10-micron, ultra fine mist that fills a space and wraps 360 degrees around every surface without leaving moisture or residue. Through extensive R&D and nozzle testing, that vision became the Genesis360™ Misting System—the foundation of Secure Logic's technology platform for automated, whole-environment pathogen control with minimal labor.

# GENESIS360™ SYSTEM LINEUP

All Genesis360 Systems utilize a proprietary patent, sub-10 micron, ultra-fine mist technology.

## InRoomMist – Whole-Room Treatment

(Designed for larger spaces)

- Fully automated systems with ceiling/wall installed nozzles for complete room coverage and dust suppression
- Ideal for classrooms, offices, gyms, medical and aging care facilities

## HVACMist – Automated Air Handler Treatment

- Integrates into air handler for timed micro-blast protection on the coil, blower and mechanical components from mold and biofilm
- Fully automated, runs on a daily schedule for coverage 365 days without human touch

## Compact – Designed for Small Spaces

- Ideal for small rooms, confined spaces, or anywhere only a single nozzle is needed.
- Single unit, multi-room capability, designed for permanent wall mount or detachable roaming use. Bracketed system allows for flexibility.
- Great for fitness centers, locker rooms, classrooms, etc.

## MobileMist (Small Handheld) – On-Demand Precision

- Lightweight handheld unit for emergency restoration and controlled spot disinfection
- No power cords needed, rechargeable battery or complex setup. No cord trip hazards.

## Products In Development

## MedicalMist – Critical Environment Configuration

- Designed specifically for medical use ORs, isolation rooms, cleanrooms, labs, dialysis
- Fully automated, treats air and surfaces without humidity/temperature change or residue

## PortableMist – Rollable Multi-Room System

- Cart-based unit fully transportable for shared use across multiple rooms and/or facilities.
- Ideal for schools, first responders/transportation, detention/public safety, and budget-sensitive facilities

## AgriGuard – Agriculture & Cannabis

- For animal barns, greenhouses, vertical grow facilities, grain storage, and controlled-environment agriculture buildings, aids in dust suppression
- Fully automated, 360-degree wrap-around coverage envelops whole plant and reaches rafters, covering the entire facility to reduce disease pressure without oversaturation or changing humidity
